EXPERIMENT

Title

SUM OF NUMBERS AT PRIME FACTORS

Description

Prime factors of a positive integer are the prime numbers that divide that integer exactly.

Given an array arr of n integers and a positive integer num.

Let's suppose prime factorization of num is: p^a x q^b x r^c x .... x z^f ,where p,q,r...z are prime numbers.

Sum of numbers in array arr at indices of prime factors of number num is: a x arr[p] + b x arr[q] + c x arr[r] +...... + f x arr[z].

You are given an array arr of size n and a positive integer num. You are required to calculate the sum of numbers in arr as mentioned above, and print the same.

Note:

- If arr is empty, print -1.
- If prime factor of num not found as indices, print 0.

Input Format:

The input consists of three lines:

- The first line contains an integer, i.e. n.
- The second line contains an array arr of length of n.
- The third line contains an integer num

The input will be read from the STDIN by the candidates.

Output Format:

Print the sum that was mentioned in the problem statement.

Example:

Input:

6

11 21 32 45 1 23

6

Output:

77

Explanation:

$6 = 2^1 \times 3^1$

$sum = 1*arr[2] + 1*arr[3] = 1*32 + 1*45 = 77$

Source Code:

```python
import math
def isprime(n):
    for i in range(2,int(math.sqrt(n))):
        if n%i==0:
            return false
        return true
N=int(input())
A=list(map(int,input().strip().split()))
p=int(input())
numsP=dict()
for i in range(2,P+1):
    while isPrime(i) and P%i=0:
        if i in numsP:
            numsP[i]+=1
        else:
            numsP[i]=1
        P=P//i
answer=0
for key,value in numsP.items():
    if key
```
